

About Technofora '26:

- Welcome to the flagship Hackathon at Technofora '26, proudly hosted by the International Society of Automation (ISA) Students Chapter, Nirma University. Building on a rich legacy of innovation, technical excellence, and industry alignment, Technofora continues to serve as a premier national platform bringing together bright minds from across Gujarat and India. Designed to push the boundaries of technology, this high-energy competition challenges participants to develop cutting-edge solutions across robotics, industrial automation, and computer science. Beyond the intense coding and prototype building, the event offers a collaborative space where students transform theoretical knowledge into real-world applications under expert mentorship. Prepare to innovate, solve complex problems, and showcase your expertise on one of the region's most esteemed stages. Good luck!

About Hackathon:

- **Technofora'26 Hackathon**, proudly hosted by the **International Society of Automation (ISA) Students Chapter, Nirma University**, is a national-level innovation challenge that brings together students to develop impactful, real-world solutions across **AgriTech, HealthTech, GreenTech, PropTech, FinTech, and SmartCityTech**. Participants will work in teams of **3–5 members** to transform their ideas into functional prototypes, combining technical implementation with creativity, innovation, and practical viability. The hackathon encourages the use of open-source technologies, public APIs, and AI-assisted development tools while challenging participants to build sophisticated and original solutions. Projects will be evaluated on **Technical Implementation (30%), Innovation & Originality (25%), Impact & Viability (20%), Design & UX (15%), and Live Pitch & Q&A (10%)**, with a **₹15,000 cash prize pool along with exciting prizes** awaiting the best teams.

The Problem Statements:

- At the heart of this hackathon are the problem statements—carefully curated challenges designed to spark innovation and address pressing, real-world issues. Rather than simply writing code, your goal is to build impactful solutions that bridge the gap between technology and everyday life. We encourage you to look beyond the obvious, break down the core mechanics of your chosen problem, and engineer a working prototype that is as viable as it is technically impressive. Pick the challenge that ignites your team's passion and remember that the most groundbreaking projects often stem from a fresh, empathetic perspective on a familiar issue. The team must choose any one of the Below given 6 Problem statements:

Mandatory Project Requirement: Functional User Interface (UI)

Every submitted project across all tracks must include a working, user-accessible front end. Pure back-end scripts, terminal-only commands, raw database pipelines, or headless code repositories will not qualify on their own. Regardless of the underlying technology—whether your team builds machine learning models, automated data workflows, or conversational AI bots—the tool must be packaged into a tangible, easy-to-use form. This can be a responsive website, a mobile application, a visual dashboard, or an interactive messaging interface that an ordinary person can open, interact with, and understand without touching code.

1. Agritech: Intelligent Farming & Digital Marketplaces

Agriculture involves a complex journey from planting seeds in the soil to selling fresh produce in dynamic markets. Many small-scale farmers struggle because they rely on intuition rather than real-time data to protect their crops, manage water and soil health, and adapt to unpredictable weather patterns. Furthermore, traditional agricultural supply chains often isolate growers from fair market prices and broader consumer networks, resulting in post-harvest losses and lost income. Projects in this track can explore any digital web or mobile application that connects farmers with actionable agricultural knowledge, automates routine crop health monitoring, or creates direct, transparent bridges between local producers, bulk buyers, and retail consumers through simple, accessible screens.

2. HealthTech: Accessible Care & Intelligent Patient Support

Navigating modern healthcare is often intimidating and fragmented for ordinary people, whether they are trying to interpret confusing medical paperwork, schedule care, or manage a chronic condition at home. Most healthcare tools are built for trained clinicians rather than regular patients, leaving individuals overwhelmed by complex jargon and disconnected from their own health routines. Teams in this track should design web apps, mobile tools, or accessible conversational interfaces that make personal wellness, preventative care, and clinical interactions intuitive and patient-centric. Solutions can focus on simplifying medical records, improving communication between patients and care providers, assisting with daily health tracking and adherence, or lowering barriers to basic medical guidance for underserved communities.

3. *GreenTech: Sustainability Tracking & Circular Economy Platforms*

While many individuals and organizations want to live and operate sustainably, they often lack clear visibility into how their daily choices impact the planet. Sustainable habits frequently feel inconvenient, and valuable goods—from electronics and clothes to household appliances—are discarded simply because there is no frictionless way to pass them along, repurpose them, or recycle them correctly. Projects in this track should empower communities, campuses, or businesses to adopt environmentally responsible practices through software with engaging front-end experiences. Teams can build web portals or mobile apps that measure and visualize resource consumption, incentivize conservation habits, or foster circular economies where goods and materials are continuously shared, repaired, and reused rather than thrown into landfills.

4. *PropTech: Next-Gen Real Estate & Living Space Management*

Finding, leasing, and living in shared residential or commercial spaces involves substantial friction, especially for first-time renters and young adults navigating rental markets independently. Common pain points include opaque contractual agreements, difficulty finding compatible housemates, delayed property maintenance, and poor transparency in property valuations and living costs. This track encourages solutions that bring transparency, fairness, and modern digital workflows to real estate and communal living through accessible web platforms or mobile apps. Ideas can span tools that simplify legal agreements, platforms that improve co-living experiences and roommate matching, or interactive systems that streamline communication and maintenance between tenants, property managers, and service providers.

5. *FinTech: Smart Personal Finance & Secure Digital Transactions*

Achieving financial independence requires managing daily budgets, understanding credit, planning for the future, and avoiding digital fraud—skills that are rarely taught effectively in standard school curricula. As digital payments and online transactions become the default standard, young adults often struggle to keep track of their spending, demystify investing concepts, and protect their accounts against increasingly clever digital scams. Projects in this domain should focus on making financial literacy and money management automated, inclusive, and protective via interactive web or mobile platforms. Teams can explore intelligent spending and savings tools, beginner-friendly financial education platforms, alternative credit evaluation methods, or user-friendly security systems that safeguard everyday digital transactions.

6. *SmartCity Tech: Civic Engagement & Urban Mobility Software*

Urban communities thrive when public infrastructure is reliable, streets are safe, and transportation flows efficiently, but cities often struggle to identify and address neighborhood problems in real time. Citizens frequently observe broken infrastructure, transit delays, or safety risks in their daily commutes without having a convenient or responsive channel to make their voices heard by local administrators. This track focuses on building citizen-centered software, community dashboards, and mobile applications that improve urban living and civic participation. Solutions can explore ways to crowdsource and visualize neighborhood feedback, optimize local transit and public commuting, enhance neighborhood safety networks, or use open city data to make communal services more responsive and transparent.

Judging Criteria:

Evaluation Metrics

The jury will score the final submissions based on the following criteria:

Criteria	Weightage
Does the solution tackle the problem from a new angle? Is it unique?	25%
The complexity of the code, functionality of the live demo, and effective use of the tech stack.	30%
Does the solution address a real-world problem? Is there a clear use case?	20%
How intuitive, accessible, and visually appealing is the final prototype?	15%
The clarity of the video demonstration and ability to defend tech choices and extent to which git rules are followed	10%
